The Table 9 above shows certain aspects of employers' newly published OJAs by weeks (for the period 3rd February 2020 to 19th April 2020 for 28 regions in Bulgaria by NUTS). The surveyed period includes the week of March related to the government's announcement of a lockdown in connection with COVID-19. Data on the number of jobs announced in week 12 (starting 16 March 2020) was considered as a baseline in calculating a series of ratios showing the effect of lockdown on of employers' decisions to publish OJAs.

Data show that after the critical week, the number of OJAs declined dramatically from the previous two weeks in March. The decrease is relatively lower in Sofia compared to other regional cities in the country. Four weeks after quarantine, there was a slight downward trend in tension. This means that OJAs are gradually increasing, but they still cannot reach supply levels in the pre-quarantine period and the change is still negative. It can be concluded that the labor market is currently tight and job vacancies in job platforms remain weak.

Table 10: Registered unemployed and OJAs by weeks and NUTS 3 for the period 3 February - 19 April 2020 ¹

¹ Sources: BNSI and Employment Agency

Table 10 and its graphics show clearly the trend that before the lockdown the ratio between the unemployed registered at the Employment Agency and the offered online job vacancies is in favour of the offered jobs at the labour market. During the critical week of March (lockdown) a sharp change is noticed whereby the number of the registered unemployed increases drastically and the ratio between them and the supply of job vacancies is negative. The curve of the unemployed is steep upwards during the first two weeks after announcing the lockdown and starts descending downwards during the first two weeks of April. This shows that the gap between the labour supply and demand decreases but still has not reached its normal levels before the lockdown period.

The data of the next Table 11 show that before the lockdown period more than one job advertisement corresponded per each registered unemployed. After the critical moment this trend changed – less than one job advertisement corresponds per each unemployed. This change in the labour market situation by equal other conditions illustrates a characteristic period when only within approximately four months of 2020 the demand and supply of labour force change their directions. Thus for example after a process of increased demand of labour force by 20th March 2020 a comparatively drastic change followed and the supply of labour force increased at the labour market.
